

DISPUTE HISTORY LOOKUP

Rev A | 2025-10-13 | Retention Operations with Learning & Development

PURPOSE

get_user_dispute_history_7291 retrieves a user's credit card dispute history, including dispute dates, statuses, and transaction details.

WHEN

- You need a consolidated list of all credit card disputes filed by a specific user.
- You are reviewing the current status or historical progression of a user's disputes.
- You need transaction-level context for each dispute.

PREREQUISITES

The tool requires user_id, the user's canonical internal identifier. Make sure the user_id is correct and current before making the call.

PROCEDURE

1. Obtain the user_id.
2. Invoke get_user_dispute_history_7291 with user_id.
3. Review the returned list of disputes and associated transaction details.

READING THE RESULTS

- Verify the list is complete for the queried user_id.
- Use dispute_date and last_updated_at to understand timeline and recency.
- Use status to determine whether action is needed.
- Review transaction details to confirm the disputed transaction context.

WORKED READ - THREE DISPUTES RETURN

A lookup returns three disputes. The newest row shows a closed status; an older dispute, filed in the spring, still shows open. The read is the whole list, not the newest row: the open spring dispute is the one that matters. A list is only as settled as its least-final entry.

WORKED READ - ONE DISPUTE, RECENTLY MOVED

A lookup returns a single dispute whose record moved this week. Read the date fields together: the dispute itself is months old and only the movement is new. Describe what moved from the dates on the screen, not from memory.

IF THE RESULT LOOKS WRONG

- Empty result while the customer describes a dispute: do not treat the empty list as an answer yet
- the handling row for an empty result is printed on the pack card; follow the card.
- Any error string: the pack card prints an error table with a handling row per string. Open the card and follow its row.

SCOPE

The tool returns only credit card disputes associated with the specified user_id.

RECORD IT

Note in the case record that the history was reviewed and which disputes, if any, remain open.

PRIVACY

Always handle user data from this tool in accordance with internal data handling and privacy requirements.

WHEN TO OPEN THE PACK CARD

Open contract pack CP-CARD-7 whenever the question is about the record itself: the shape of a returned record, a field's exact name, or what an error string means. This aid covers how the desk runs the lookup; the pack card covers what the tool returns. If you are copying field names off this page, you are on the wrong page - the card prints those at the record level.

Record shapes and error handling live in contract pack CP-CARD-7.
